## Firestore data structure:

The setup extremely basic to make it easy to work with, every document has a randomly generated ID, and two fields, userid and value. The app runs a query that filters based on userid, and only returns the list items that belong to the user.

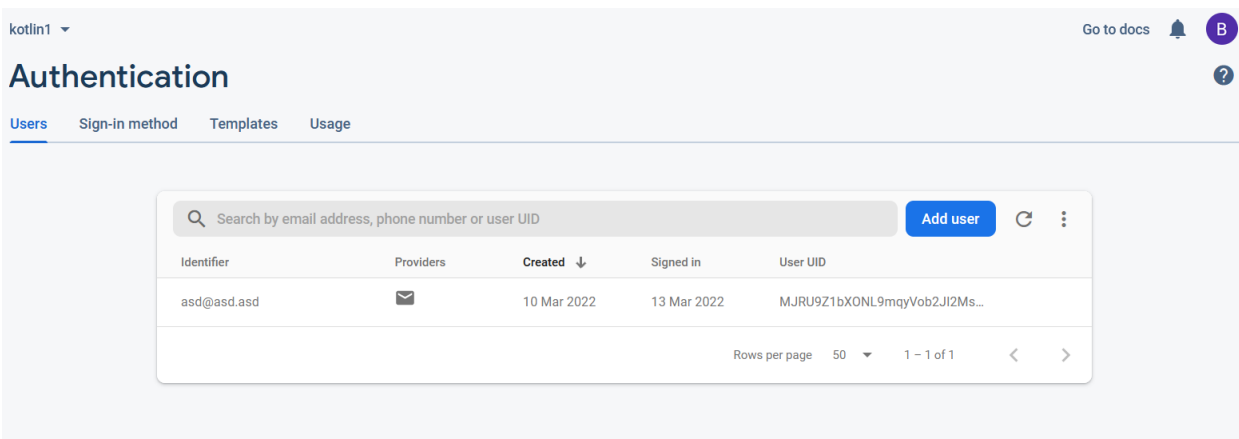

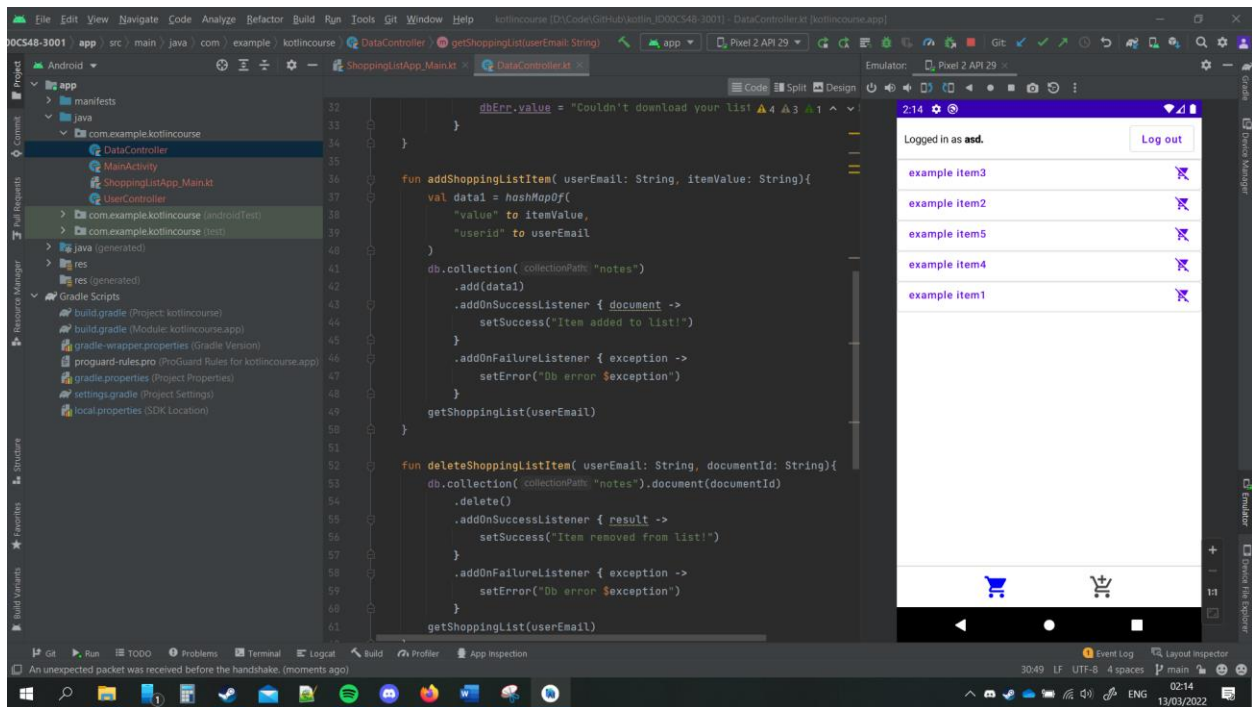

Authentication setup:

For easy testing, the following account can be used in the app:

Username: asd@asd.asd
Password: 123456

When logging in, this is roughly what the app should display:

Additional features:

- Timed notifications for error and success messages to give the user feedback on their actions.
- The footer selector menu highlights the current selected view by changing the icons' colours.
- The app stores the list in the cloud and automatically updates it when changed.
